[Annex - The first estimate of yield in 2024 \(ZIP - 60 kB\)](#)

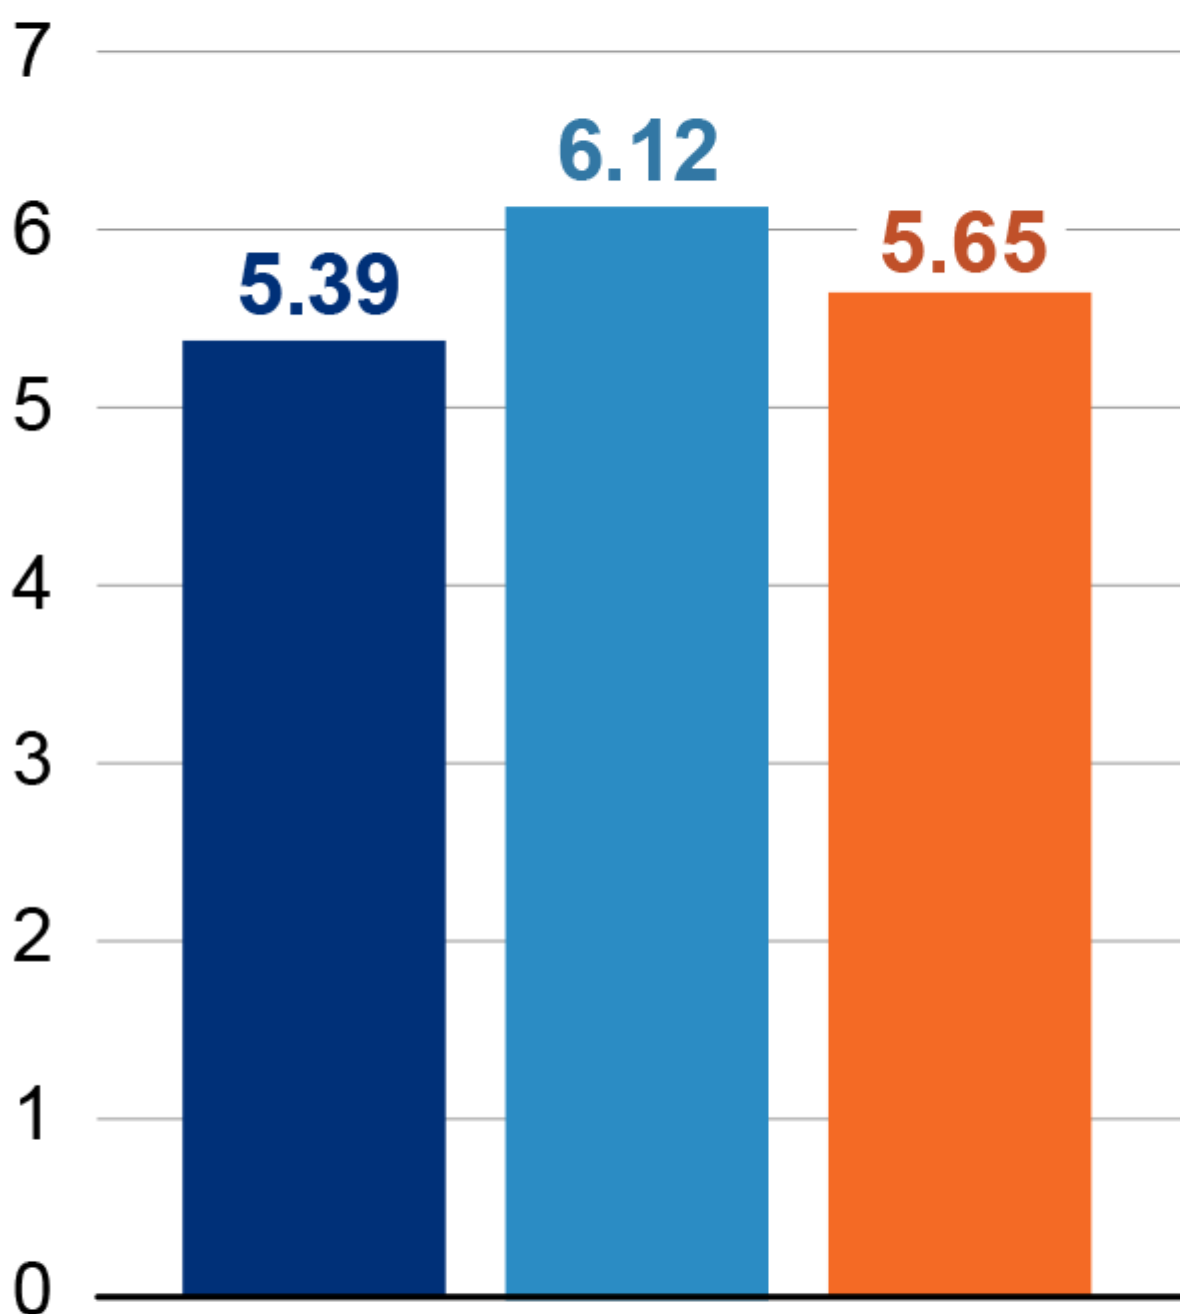

The lower harvest of densely sown cereals and rape is affected by the decrease in sown areas and lower yields per hectare

The first estimates indicate a year-on-year decrease in the harvest of densely sown cereals by more than 14%. However, yields per hectare of almost all cereals will exceed their 5-year average.

The expected total harvest of densely sown cereals at the level of 2.7 mil. tons should be lower by almost 460 thous. tons compared to last year's final harvest. The year-on-year decrease by over 14% was mainly due to a significantly lower cultivated area of wheat.

The total sown area of densely sown cereals was 506.9 thous. ha, which is about 43 thous. ha less than last year. The year-on-year decrease in sown areas is at the level of 7.8%. Similarly, the rape harvest should decrease by 22% year-on-year. Approximately 420 thous. tons should be harvested, with an expected yield of 2.95 tons per hectare. This follows from the first estimate of the yield, processed by the Statistical Office of the SR on the basis of data surveyed as of June 20 2024.

The first estimate of y (in tons, data as of 20 June)
