

Water management

24.04.2014 |

Water management statistics deals with the production and distribution of fresh water, volume and quality of waste water (treated and untreated), quality of surface water in water courses and water quality in lakes and water reservoirs. Data on incomes from sale of drinking water and payments for collecting and treating of waste water are collected as well. Water statistics also deal with water structures (including water supply systems, waste water collecting system and waste water treatment plants).
