The new PRODCOM list of industrial products better reflects industrial production

With financial support from a Eurostat grant, the Statistical Office of the SR has implemented several changes and improvements in the field of classification of product codes produced across industrial statistics. The modernization of the classification enabled to capture new types of products, or a more detailed monitoring of products in sectors with a significantly changed product portfolio.

As part of the grant, the Statistical Office of the SR started to use an innovative classification of all industrial products through the PRODCOM code list (in the Slovak version PRODSLOV) according to the CPA rev. 2.2 classification of products. The new products that have only started to be produced recently due to technological progress and changes in the market have been added to the list. At the same time, outdated products that are no longer produced have been removed from the list. Thanks to these adjustments, the list is more up-to-date and better reflects the real situation in industry. As part of this change, selected data on so-called strategic products have also started to be submitted to Eurostat monthly.

Based on the currently valid classification of economic activities (NACE rev. 2), it was possible to determine more precise information on the activities of individual enterprises with 20 or more employees according to the new version of the classification (NACE rev. 2.1) using the information from the reporting units.

At the same time, a converter was created that allows classifying products according to the original and new codes according to the PRODCOM classification, based on CPA rev. 2.1 and the new CPA rev. 2.2. By means of this tool, historical data on the variables of actual production, sold production and production under sub-contracted operations for the reference years 2022, 2023 and 2024 was updated.

Part of the data for completely new products will be collected for previous years in the annual survey on the production of industrial products and industrial services for 2025 in spring 2026.

In the second part of the grant project, the Office compiled a database of monthly data on strategic products for the years 2022 to 2024 based on the collected product codes according to the Slovak classification of products - PRODSLOV. Since January 2025, this data has been collected regularly monthly and subsequently submitted to Eurostat in the form of statistical information, which enables a more detailed monitoring of the development of industry in Slovakia.

The Statistical Office of the SR, with grant support from the European Commission, is implementing new requirements and improving the quality of national and European statistical products within the European Statistical System (ESS). These are activities within the Single Market Programme.
