The Slovak industry stagnated in February, the decline of most sectors was covered by energy and manufacture of electrical equipment

The key sector of the Slovak economy, industry, developed comparable to last year after half a year of recovery. Up to two-thirds of sectors of industry, including automobile companies, recorded a year-on-year lower performance. Furthermore, a significant drop in mining continued, where production d by more than 41%, mainly due to the closure of mines.

Industrial production¹⁾ of the SR remained at the same level as last year in February 2024. After the recalculation of the long-term time series of data due to the transition to the new base period of 2021, industrial production stagnated year-on-year after six months of continuous growth.

The Statistical Office of the Slovak Republic would like to inform that starting from the data for January 2024, all values of the year-on-year indices of industrial production have been recalculated due to methodological adjustments - [the change to a new base period \(from 2015 to 2021\)^{2\)}](#) (PDF - 220 kB).
